CeliaCaii left a comment

I think you forgot to pull from develop, because you are removing stuff you did before

CeliaCaii reviewed 5 hours ago

ERP/app/Http/Kernel.php

```
58   -         'accountant.access.only' => \App\Http\Middleware\AccountantAccessOnly::class,
59   -         'sales.access.only' => \App\Http\Middleware\SalesAccessOnly::class,
```

Comment on lines -58 to -59

CeliaCaii 5 hours ago • edited

Remember to pull from develop before you create your new branch, you're deleting these that you introduced. There are also other files that you are deleting. They are all related to creating a middleware and seeder for accountant and sales

CeliaCaii left a comment

I left some comments regarding Sales. Sales should be accessible by sales person, but NOT accountant.
Also, I think IT personal cannot access Accountant page either

ERP/resources/views/components/navbar.blade.php

```
67  +                  <li class="nav-item">
68  +                      <a class="nav-link active" href="{{route('sales')}}">Sales</a>
69  +                  </li>
```

Comment on lines +67 to +69

CeliaCaii 9 hours ago

Accountant does not have access to Sales, it is the sales person that has access to Sales page.
The endif should end at line 66

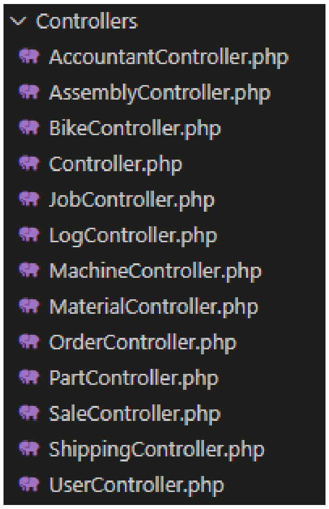
Code conventions

Conventions:

- We are following basic Laravel code conventions as documented here: https://webdevetc.com/blog/laravel-naming-conventions/

Supportive images (for Proof):

One of the conventions is that the name of controllers should be capitalized at each word.



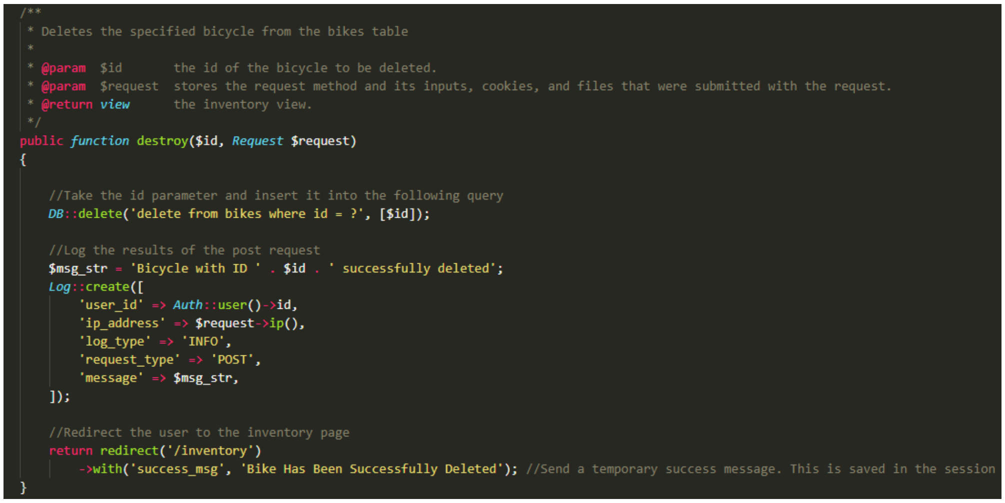
```
Controllers
  AccountantController.php
  AssemblyController.php
  BikeController.php
  Controller.php
  JobController.php
  LogController.php
  MachineController.php
  MaterialController.php
  OrderController.php
  PartController.php
  SaleController.php
  ShippingController.php
  UserController.php
```

Quality of source code documentation

Conventions:

- Add comments wherever the code is not intuitive.

Supportive images (for Proof):



```php
/**
 * Deletes the specified bicycle from the bikes table
 *
 * @param  $id       the id of the bicycle to be deleted.
 * @param  $request  stores the request method and its inputs, cookies, and files that were submitted with the request.
 * @return view      the inventory view.
 */
public function destroy($id, Request $request)
{

    //Take the id parameter and insert it into the following query
    DB::delete('delete from bikes where id = ?', [$id]);

    //Log the results of the post request
    $msg_str = 'Bicycle with ID ' . $id . ' successfully deleted';
    Log::create([
        'user_id' => Auth::user()->id,
        'ip_address' => $request->ip(),
        'log_type' => 'INFO',
        'request_type' => 'POST',
        'message' => $msg_str,
    ]);

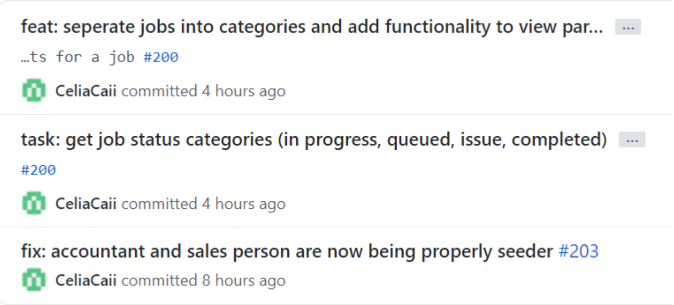
    //Redirect the user to the inventory page
    return redirect('/inventory')
        ->with('success_msg', 'Bike Has Been Successfully Deleted'); //Send a temporary success message. This is saved in the session
}
```

Commit messages

Conventions:

- Our commit as well as branch and PR naming conventions are documented in our GitHub wiki (https://github.com/mlee97/SOEN-390-Team5/wiki/GitHub-Conventions).
- Essentially, commits should start with a token (eg. feat, fix, task, etc), followed by a description and the issue #.

Supportive images (for Proof):



feat: seperate jobs into categories and add functionality to view par... …

…ts for a job #200

CeliaCaii committed 4 hours ago

task: get job status categories (in progress, queued, issue, completed) …

#200

CeliaCaii committed 4 hours ago

fix: accountant and sales person are now being properly seeder #203

CeliaCaii committed 8 hours ago

Testing coverage

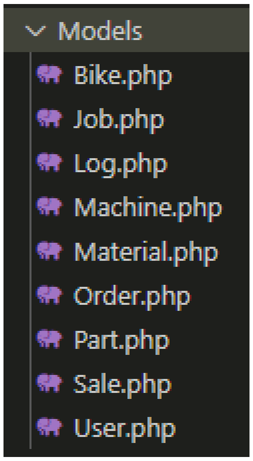
Design pattern

Conventions:

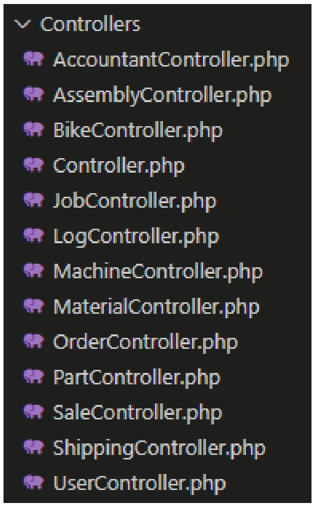
- Follow MVC pattern.
- Also used factories.

Supportive images (for Proof):

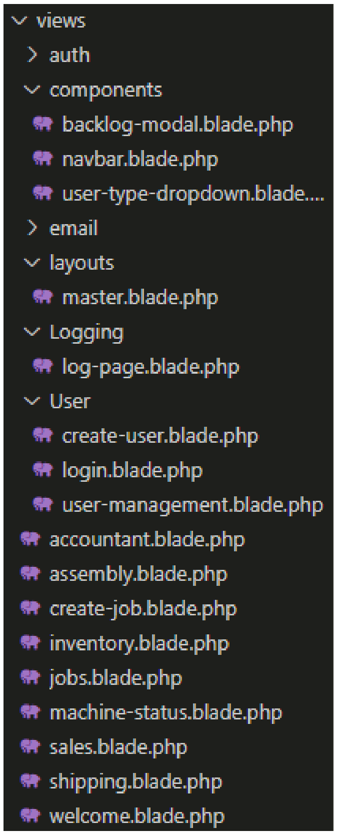
MVC:



```
Models
  Bike.php
  Job.php
  Log.php
  Machine.php
  Material.php
  Order.php
  Part.php
  Sale.php
  User.php
```

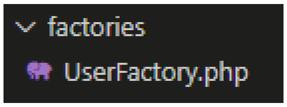


```
Controllers
  AccountantController.php
  AssemblyController.php
  BikeController.php
  Controller.php
  JobController.php
  LogController.php
  MachineController.php
  MaterialController.php
  OrderController.php
  PartController.php
  SaleController.php
  ShippingController.php
  UserController.php
```



```
views
  auth
  components
    backlog-modal.blade.php
    navbar.blade.php
    user-type-dropdown.blade....
  email
  layouts
    master.blade.php
  Logging
    log-page.blade.php
  User
    create-user.blade.php
    login.blade.php
    user-management.blade.php
  accountant.blade.php
  assembly.blade.php
  create-job.blade.php
  inventory.blade.php
  jobs.blade.php
  machine-status.blade.php
  sales.blade.php
  shipping.blade.php
  welcome.blade.php
```

Factories:



```
factories
  UserFactory.php
```
